Reminder: Next week mockdef.

Cover chapter 1-2

Update sa system 50% above

(USE IT WITH CAUTION hshs)

Capstone1:

CHAPTER 1: Ano ang problem na sinsagot ninyo?

CHAPTER 2: Ano yung mga studies na pwede mag support ng idea gagawa kayo ng system?

CHAPTER 3: Paano niyo gagawin ang system? (Methodology)

CHAPTER 1:

Project context: current situation sa client pano mga user ninyo? Bakit kailangang yung system nayan? Like ano mga problems and ano ang solution. Hihimayin sa paper.

Chapter 1 technical background: describe the technology na mag ssupport ng mga system and infrastructure na gagamitin to build your system (mga hardwares na gagamitin)

Software: Programming language na gagamitin, database, OS na gagamitin, ano yung framework. (what you use to develop the system?)

People/ manpower: ano yung mgataong involvle and sino mga involve, The peopleware.

Network infrastructure: how nag cocomunicate yung mga devices. (ex. Lan)

Storage, backup, recover:

:how you will ensure, protect, and backup the data.

:How i-rerecover and babackup. Pano strategy?

Security Procedures: ex. Login authentication, ano mga credentials and saan mangagaling yung code or password and roles access control. Anong mga encryption gagamitin and gagawin.

Policies and procedures : paano gagamitin ang sytem properly, guidelines and policies for the system.

Problem analysis: identify the current issues ano root cause and effects. Like a fishbone diagram. (fishbone hihimayon duon people process technology and environment the usual depends sa system , root cause analysis. root cause and naging Problem)

Problem & solution statement: you need to define the problem and proposes ng system. Problems why nag came up sa mga features nayon and system na iyun. Problem coming from the client.. the solution gaaling sa atin. Pag mukain sa paper na tayo nagbigay ng solution.

Problem requirements matrix: this will connect your problem to the system requirements. Ano and paano macoconnect yung problem sa system requirements.

Purpose & description : for purpose overall goal ng system, for description ano mga system functions ano connections. The overview.

Specific objectives: measureable and attainable.

Scope and limitations: pag system scope ano yung system na kayang gwawon kayang gawin ng System niyo? Limit ano di kayang gawin ng system setting boundaries to your system.

Definition of terms: you will define the key terms using your studies (mga notes niyo or definition na di maintindihan ng iba)

CHAPTER 2:

RRL

: Ano ang rrl ..studies or topics na mag ssupport ng mga projects.

: Ano mga bago and support it. Ano difference from that sudy sa study niyo.

: ano previous research.

: RRL required 5 yrs from now.

:references.

:related studies almost the same sa system that you can relate what you can connect.

:existing system ano nag eexist na system.

Synthesis of the study: Paano issum yung RRL.. You will compare the previous studies and explain why need mag propose ng system, why is it necessary?

METHODOLOGY: What is the method that you will be using (e.g. requirements analysis: ano yung mga dapat ma accomplish ng system ninyo?) Gather the requirements then identify the user needs.

USE CASE DIAGRAM: you will show here how your user will react to the system. Actors + the system function.

: paano mag iinteract mga user ninyo sa system functions ninyo.

: ano mga user niyo and how it will work.

:Sino gagamitin each roles and ano ma access nila (there's a picture shown below)

:In every diagram you should have an explanation EVERY DIAGRAM.

ACTIVITY DIAGRAM: All functions.. Shows the system work flow

: ano kayang gawin ng system ninyo. (picture sample below)

GUI DESIGN: System interface mockups: **ano itsura ng system niyo lahat lahat each interface and functions**.

DATABASE SCHEMA: Tables and relationships.

: Structure that will show your data pano ma c-conect sa database. (picture sample below). NO TO AI (this is based on your system functions)

DEVELOPMENT METHODOLOGY: (Examples: agile, waterfall, SDLC)

TEST METHODOLOGY: by using these methods yung system niyo ay mag wwork ng tama. EXPLAIN HOW AND WHY.

TYPES OF TESTING:

-Unit testing

-Integration Testing

-System testing

-Acceptance testing

SYSTEM REQUIREMENTS: Hardware

:Software

:Network

ETHICAL CONSIDERATIONS: Data privacy, User consent, confidentiality..

DATA ANALYSIS: How data will be analyzed.

(e.g. Surveys, Evaluation forms, system testing results.(Here you need QA or the panelist) (panelist gagalaw ng mga system, they will control it.)

STATISTICAL STATEMENTS: Interpret your data and resullts under statsical statement.

- Frequency
- Percentage
- Mean

CONCLUSION:

Capstone 1 focuses on : Problem identification

:Literature overview

:System design methodology.

PROBLEM REQUIREMENTS MATRIX

PROBLEM	REQUIREMENT
Manual reports	Automated reporting
Data errors	Validation system

Sharifa Abirin (Presenting, annotating)
